Oilseeds and Products

Annual Report

2007

Approved by:

Fred Kessel
U.S. Embassy, Jakarta

Prepared by:

Aji K. Bromokusumo/Elisa Wagner

Report Highlights:

The euphoria of biofuel development has led to increasing demand for CPO. Future development of biodiesel has the prospect to drive Indonesian CPO production although it remains to be seen when and if production truly takes off. Soybean imports remain strong due to increasing demand and decreasing local production. The increase in snack food consumption will increase food use domestic consumption of peanuts. However, the area planted and production will decrease as farmers choose to plant crops that offer higher profits, such as corn.

Executive Summary

- Soybean consumption will continue its steady growth and the United States will continue as the dominant supplier in 2006 and into 2007.
- Concern over avian influenza has affected the purchasing ability of poultry producers, the largest buyer of soybean meal. In 2007, price will continue to be the main determinant of purchasing decisions.
- Government policy and high prices encourage new plantings of palm oil trees, but production levels will not be high enough to keep food and fuel from competing for CPO supplies.

OILSEEDS

Soybeans

Notwithstanding ambitious Gol plans to achieve self-sufficiency in soybean production, soybean production is forecast to decrease slightly. Continuous problems with land availability, quality seeds, fertilizer distribution, higher production costs, and attractiveness of other crops that offer higher profits for farmers will keep Indonesia from realizing its plans for self-sufficiency in 2006 and 2007.

However, soybean use for direct consumption as tofu and tempe continues to grow. U.S. soybeans are preferred because of texture, color, and smell even though lower-priced soybeans are available from other sources and a 10 percent import duty was applied last year.

Market share for U.S. soybeans is over 90 percent, up from last year. Most soybeans from the United States come in containers because container vessels shipping products to the United States are bringing soybeans on the return trip.

As a result of the situation, soybean imports will remain strong and the United States will remain the dominant supplier. The growth in imports is steady, about 14 percent for the forecast year, because domestic consumption both for food and feed is up. Soybean imports are forecast to grow to about 1.6 million tons in MY 2007.

Peanuts

The increase in snack food consumption will increase domestic consumption of peanuts. However, the area planted and production will decrease as farmers choose to plant crops that offer higher profits, such as corn.

MEALS

Soybean Meal

Imports of soybean meal are forecast to grow from 1.78 million tons in MY 2006 to 1.9 million tons in MY 2007.

Soybean meal imports are used almost exclusively for poultry feed. There is a small domestic feed processing industry that is growing at about 3-5 percent per year, but the sector is experiencing cash flow and financing difficulties, reportedly due to avian influenza.

Poultry producers are unwilling to buy feed for more than short-term because sudden shocks when a human case of avian influenza is reported impacts cash flow. Since banks consider the poultry and related industries to be high-risk so they are reluctant to provide short-term financing for soybean meal imports.

Soybean meal from South America is preferred because of its consistent protein content, but price is still important to decision making. Brazil is considered to offer the best quality in terms of protein content, but almost half of all soybean meal is imported from Argentina because of price.

Palm Kernel Meal

In line with the increase in palm oil production, palm kernel production in MY 2007 is expected to increase to 2.4 million tons, of which about 80 percent is exported. The Netherlands is the leading destination with 65 percent of Indonesian exports, followed by South Korea (16%) and Germany (8%).

OILS

Palm Oil

Enthusiasm for the potential for biodiesel, high CPO prices, and announced government policy encouraged an increase in new planting in 2006 and this is expected to continue in 2007. In MY 2006, production is estimated to increase 3 percent, but this is lower than originally anticipated because dry conditions were severe enough to impact production for 2 months during 2006. Higher prices and lower than anticipated exports followed lower production in 2006, which was also due to dry conditions.

In 2006, GoI announced a big push to increase palm oil production using up to 1.8 million hectares of land for development of new palm oil plantations. The original plan called for the large, new production to be used as input for biodiesel, while maintaining current production levels for food oil. However, the amount of suitable land available is limited. On Sumatera, where most palm oil plantations are located, most potential land is protected. Aceh is the only area with significant potential, but civil strife makes it less attractive. Other areas for developing new palm oil plantations are limited due to inappropriate land type, lack of infrastructure, and land rights issues. Other hurdles to meeting the government's short-term plans are the availability of seeds, heavy equipment to clear land, and employees.

Therefore it appears GoI is adjusting its plan to focus increasing production yields on smallholder plantations that surround the large plantations while taking advantage of what land is available. In Indonesia, large plantations are required to act as a "nucleus" and devote 20 percent of the area surrounding the large plantation for use by smallholders. Smallholder plantations have low yields because they do not buy high quality seeds, do not use fertilizer properly, and tend to pick fresh fruit bunches too early. Trees do not produce optimally and productivity is shortened by about 5 years. Since government-owned plantations are considered to have profiles similar to smallholders, there is ample opportunity for production growth on existing plantations.

However at least in the short term, the increased demand for biodiesel will affect marketing of CPO for export and domestic use. Currently, Indonesia refining capacity for CPO is about 22 million tons and is currently running at about 16-17 million tons. In addition, GoI has issued at least 10 million tons in new permits for biodiesel production.

Domestic biodiesel consumption is expected to double in MY 2007. There is one facility under construction that is expected to be the largest biodiesel producer in the region with 350,000 tons per year capacity.

Also competing for CPO supplies will be exports. The biggest export market is shifting from India to China largely due to the higher prices being paid by the Chinese. CPO exports are forecast to reach 11 million tons in MY 2007. The single largest European buyer of Indonesian CPO is Germany due largely to the heavy demand for biodiesel. While the demand for exports to Europe remains high, requirements by Europeans that CPO be produced by sustainable means and with limited environmental impact will probably limit continued exports of CPO as a fuel input to Europe.

Also limiting Indonesian ability to export is a lack of port infrastructure. Most ports that can handle CPO are owned by palm oil companies and centralized to northern Sumatra. Total liquid bulk handling capacity in Indonesian ports is not much higher than the current level of exports.

A new regulation taking effect January 1, 2007 from the International Maritime Organization requires that vegetable fat and oil should be transported on double compartment vessels. This will increase shipping costs by 10-15 percent and could also limit the quantity and destination of exports.

Palm Kernel Oil

Palm Kernel Oil (PKO) is expected to increase as palm oil production increases. PKO production will reach almost 2 million tons, over 60 percent for export.

Oleo chemical industries have been suffering from a lack of adequate infrastructure. Two big producers in North Sumatra with combined capacity of 167,000 tons fatty acid and 17,650 tons glycerin have closed their operations because of disruptions to the local natural gas supply. The largest fatty acid export market for Indonesia is China.

Coconut Oil and Copra

Production and consumption of coconut oil from copra will increase due to recent reports that coconut oil offers greater health benefits than palm oil and that coconut oil can be converted to biodiesel.

Some villages are reported to have implemented the "Self Sufficient Energy Village" program by converting coconut oil into biodiesel or into PPO (Pure Plant Oil), which can be used directly to generate electricity from simple generators.
